

P90 PRINT DEVELOPER

Cold Tone

P90 PRINT DEVELOPER is a phenidone based developer designed to maximize cold tones without excessive gain in contrast.

P90 PRINT DEVELOPER produces rich blacks to clean whites on a smooth continuous scale. Dilution of the working solution may be varied from 1+4 to 1+9 to achieve the desired maximum densities.

P90 PRINT DEVELOPER is suitable for both tray and machine processing, with recommended temperature range from 70° F (21° C) to 90°F (32° C).

Recommended starting replenishment rate for machine processing is 0.15 ml/sq.in. paper. Machine characteristics and processing temperature will require adjustments to replenishment rate.
